

DRAFT PROTOCOL 01:
TU DELFT LAB EXPERIMENT

VARIUM: Visual Artifacts Interference Understanding and Modeling

By: Alexandre Fieno
Instructor: Dr. Judith Redi
August 22, 2013

Electrical Engineering, Mathematics and Computer Science Department
Interactive Intelligent Systems Group

Do not put the text in the future! Put in the present!

I. RESEARCH QUESTION

on the quality of video

This study aims to understand the influence of a set of artifacts and their relationship with the content of a video. It is expected, from a series of psychophysical experiments, to determine the impact of them on visual quality perception. The set of artifacts used in this study were chosen among those perceptually most relevant for digital video applications (e.g. blockiness, blurriness, packet-loss etc). Later, it is expected to design an objective metric for overall video quality considering visual attention and specific spatial and temporal artifacts, their reciprocal impact and their mutual importance for a wide range of video content.

This sentence sounds weird ..

II. EXPERIMENTAL SETUP

For the experimental session, subjects will be requested to score a set of test some videos with different combinations of artifacts. Thus, all subjects will assess all experimental stimuli and, during quality scoring, the eye-movements of the subjects will be recorded. It is expected to collect: viewing time per stimulus; scores for each attribute, video and observer; and, eye-tracking data. This experiment will require the resources indicated below:

It is expected It will be collected!!! Rewrite the sentence.

A. Video Database

The video database used in this experiment was generated from seven high-definition videos (original videos) with 1280x720, 50 fps and 10 seconds duration and that correspond to a diverse content (Basketball, Romeo and Juliet, Park Run, Cactus, Park Joy, Barbecue and Into Trees), as depicted in Figure 1. From the original videos were generated several different degraded versions (more details can be seen in the subsection II B and in the tables I and II).

S

FIG. 1: Screenshots of the first frame of the sequences included in Experiment.

B. Artifacts

New versions of each original video were generated with different combination^S of artifacts. Below, a brief comment about the artifacts and the videos versions used:

These are not percentages. These are ratios in comparison to a stronger artifact. Hard to explain here...

1. The artifacts chosen were blockiness, blurriness and packet-loss ¹;
2. 7 original videos have been distorted with different combinations of the parameters regulating the amount of packet-loss, blurriness and blockiness; at different strengths
3. 4 different strengths of blockiness and blurriness were used, such as, 0.2%, 0.4%, 0.6% and 0.8% ²;
4. Table I shows all the combinations using different blockiness and blurriness strengths. Later, they were applied in each original video versions, resulting in new degraded videos;
5. It was used 3 different packet loss ratio, PckErr.1 = 0.7%, PckErr.2 = 2.6% and PckErr.3 = 8.1% ³. Later, they were applied in 2, 3, 8, 10, 11, 12, 14 and 15 degraded video versions. Table II shows these combinations (PckErr.1 + 2 is the combination between packet loss ratio 0.2% and degraded video version 2, and so on);

I am not understanding this sentence ..

what does this mean?

Sentence in reverse order. 3 different packet loss ratios were used: ...

Combination	Blocky	Blurry
1	0.0	0.2
2	0.0	0.4
3	0.0	0.6
4	0.2	0.0
5	0.2	0.2
6	0.2	0.4
7	0.2	0.6
8	0.4	0.0
9	0.4	0.2
10	0.4	0.4
11	0.4	0.6
12	0.6	0.0
13	0.6	0.2
14	0.6	0.4
15	0.6	0.6
16	0.0	0.8
17	0.8	0.0

TABLE I: Strength of each artifacts (blockiness and blurriness) and their combinations used to generate the degraded videos.

Thus, the 41 combinations (blockiness, blurriness and packet loss) \times 7 (original videos versions) + 7 original videos will generate a total of such database of videos with 294 videos. So, some choices must be made on which videos to select one since this is a large amount to be judged in a single experiment. These choices could be based on the results of the previous experiments, as following:

1. Total time necessary consuming to execute overall experiment;
2. To consider just the overlapping of the three artifacts packet loss, blockiness and blurriness; ???

¹ These artifacts have been used in the previous experiments of this project.

² These blockiness and blurriness strengths have been used in the previous experiments of this project.

³ These packet loss ratio have been used in the previous experiments of this project.

Combination	Packet-Loss	Blocky	Blurry
<i>PckErr</i> .1 + 2	0.7	0.0	0.4
<i>PckErr</i> .2 + 2	2.6	0.0	0.4
<i>PckErr</i> .3 + 2	8.1	0.0	0.4
<i>PckErr</i> .1 + 3	0.7	0.0	0.6
<i>PckErr</i> .2 + 3	2.6	0.0	0.6
<i>PckErr</i> .3 + 3	8.1	0.0	0.6
<i>PckErr</i> .1 + 8	0.7	0.4	0.0
<i>PckErr</i> .2 + 8	2.6	0.4	0.0
<i>PckErr</i> .3 + 8	8.1	0.4	0.0
<i>PckErr</i> .1 + 10	0.7	0.4	0.4
<i>PckErr</i> .2 + 10	2.6	0.4	0.4
<i>PckErr</i> .3 + 10	8.1	0.4	0.4
<i>PckErr</i> .1 + 11	0.7	0.4	0.6
<i>PckErr</i> .2 + 11	2.6	0.4	0.6
<i>PckErr</i> .3 + 11	8.1	0.4	0.6
<i>PckErr</i> .1 + 12	0.7	0.6	0.0
<i>PckErr</i> .2 + 12	2.6	0.6	0.0
<i>PckErr</i> .3 + 12	8.1	0.6	0.0
<i>PckErr</i> .1 + 14	0.7	0.6	0.4
<i>PckErr</i> .2 + 14	2.6	0.6	0.4
<i>PckErr</i> .3 + 14	8.1	0.6	0.4
<i>PckErr</i> .1 + 15	0.7	0.6	0.6
<i>PckErr</i> .2 + 15	2.6	0.6	0.6
<i>PckErr</i> .3 + 15	8.1	0.6	0.6

TABLE II: Combinations of the packet loss ratio (PckErr 1, 2 and 3) with blockiness and blurriness artifacts.

3. The narrowing down the parameters to packet loss ratio in 0.7% and 8.1%, blockiness and blurriness strengths in 0.4% and 0.6%, respectively, because they are significantly different.⁴
4. Some artifacts can be eliminated or reduced or reducing others artifact of according its strength (for example, 0.8% strength used to blockiness and blurriness. This strength will probably eliminate a good amount of others artifacts.);

Thus, taking into account the goal of this experiment and these choices, it would result into 16 combinations \times 7 (video versions) + 7 original videos = 119 videos.

A list of all videos used in the experiment can be seen in Appendix A.

C. Apparatus

In a room with constant illumination of approximately 70 lux, each subject will access the stimuli on a 23" LED backlight monitor having a resolution of 1360 \times 768 pixels. The subjects will be seated straight ahead of the monitor, centered at or slightly below the eye height for most subjects. A chinrest will be used

⁴ The values and information have been taken out Experiment3_setup document.

to guarantee a constant distance between the subject's eyes and the monitor. The room has a table, 2 chairs, a chinrest, 2 CPUs, mouses ~~and~~ keyboards , 2 displays and a *SensoMotoric Instruments GmbH* Eye Tracker.

The Eye-Tracker will be used for tracking the pupil and gaze position during the experiment. The distance between the subject's eyes and the video monitor will be 3 times the monitor screen's height. The user interface for the experiment was implemented using the *Neurobehavioral Systems* software Presentation.

The experiment will take place at the ~~Faculty of~~ ^{Department} Electrical Engineering, Mathematics and Computer Science of TU Delft, in a designated laboratory space - HB 12.150 and 12.160 rooms.

III. SUBJECTS AND RECRUITMENT

Our goal it to recruit???

It is expected to recruit about 20 subjects from the student and staff population at TU Delft ~~observers.~~ ^{Put the department name here}
This recruitment will be done via poster (Figure 2) and publication in the Facebook Groups (i.e, in groups related to student and staff of TU Delft). In some cases, some subjects can be excluded due: to

- Vision problems that ~~are not~~ ^{cannot be} corrected such as colour-blindness;
- Visible abnormality of the eyes like strabismus;
- ~~Wearing glasses or contact lenses;~~ ^{Why???} This is not a problem!
- Lighter-coloured eyes. ^{Isn't the problem the opposite?}

IV. EXPERIMENTAL METHODOLOGY

The overall experiment will be run one subject at a time ^{It} and it is split into five tasks (Figure 3). ^{as described below.} Below ~~there are a short comment about each task.~~

1. **Equipment Calibration:** in this session the Eye-tracker ~~will be~~ ^{is} calibrate. ^d This step is essential for tracking the pupil and gaze position during the experiment;
2. **Free Viewing:** in this session ~~will be asked to the~~ ^{will be asked} participants to freely look at seven high quality videos (original movies), as if they watching TV at home;
3. **Training task:** this session will give an idea of the range of quality ^{the} that the subjects will be seeing. ^{in the experiment} It ~~is split in two parts.~~ ^{of the experiment} first part has high quality videos and second part has strongly degraded videos;
4. **Practice Trials:** In the fourth session ~~will be showed some~~ ^{sample} videos sequences to be sure that subjects understand the task. Subjects will be asked to perform the exact same tasks like in the main experiment; ^{will be shown}
5. **Main Experimental Session:** in this is session ~~will be presented~~ ^{are presented} all videos (test sequences) in random order. After each test sequence played, the subject will be asked "Did you perceive any impairments or defects in the video?", prompting for a "yes" or "no" answer (detection task). Then participants will be asked to perform the annoyance task consisting of giving a numerical judgment of how annoying the detected impairment is.

FIG. 2: Poster used for recruitment.

V. PROCEDURE

Videos will be shown in a randomized order, different for each participant. Each video will be scored using a through a slider with a continuous scale from 0 (lower bound) to 10 (upper bound), with 5 being the mid value. Each scoring scale has 2 semantic labels for the lower ("Imperceptible") and upper bound ("Very Annoying"), at the beginning and end, respectively.

During the experiment, one video at a time will be showed and, after examination, the slider will appear in a separate scoring screen. Participants enter their judgment by simply positioning the slider on the appropriate score number (continuous scale) through the computer mouse. After scoring (regarding defects), another video will be displayed, and the process will be repeated until the all videos are showed for the participant. Figure 4 shows an example of the slider.

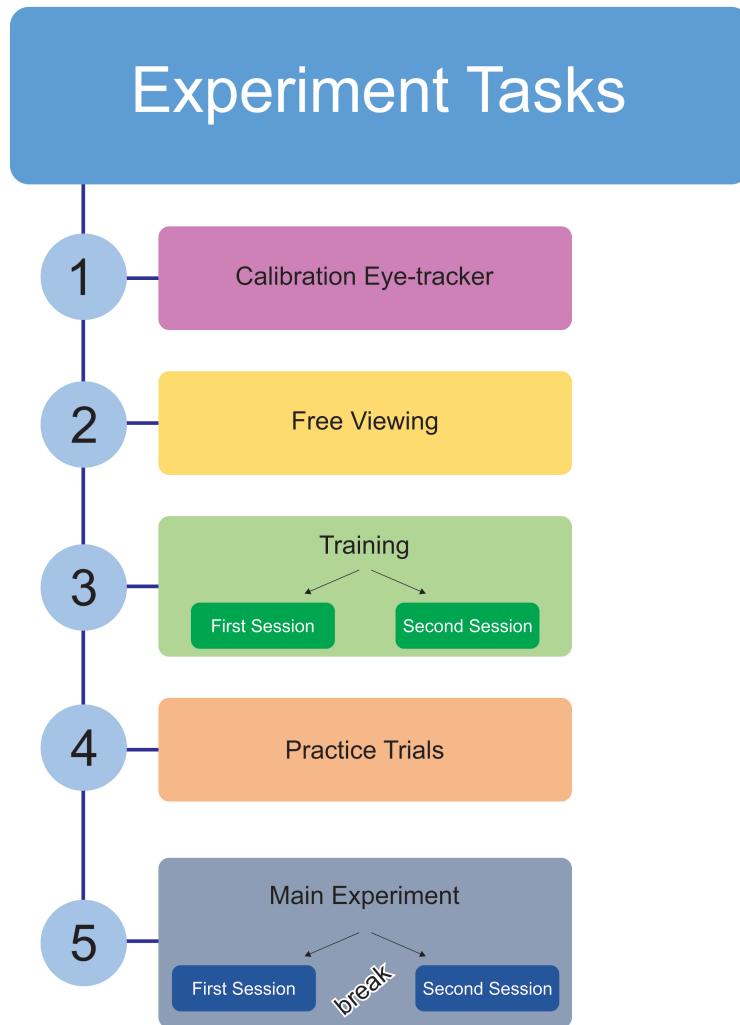

FIG. 3: Experiment overview.

A. Experiment - Details

During the experiment, the experimenter will be guiding the subject through all sessions of the experiment, so that everything can be understood clearly. The following basic steps for the experiment will be followed:

1. Inform the participant

This information seems to be repeated ...

- **Goal:** The goal of this experiment is to unveil the annoyance brought about by combinations of three different artifacts (Packet Loss, Blockiness and Blurriness).
- **Scoring screen:** Each video will be scored ^{using} through a slider with a continuous scale from 0 ("Im-perceptible") to 10 ("Very Annoying"), ~~with 5 being the mid value.~~ An example of the scoring screen will be shown to the participant so that he/she can get familiar with it.
- **Questions or doubts:** The participant can ask at any given time any question ~~or doubt that~~ he/she might have.

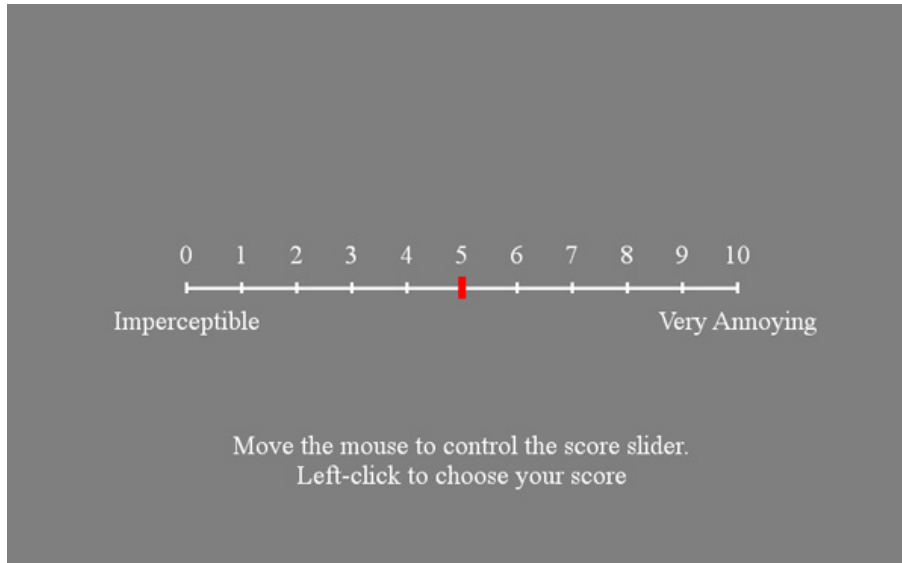

FIG. 4: Scoring screen (slider).

- **General procedure:** The experiment is split in 5 sessions: ~~an equipment calibration task~~, a free view ~~task~~, a training ~~session~~ (split in two parts), a practice trials and, a main experiment (split in two parts with a break and another equipment calibration in between).

2. General procedure details

- (a) **Calibration task:** Participants' eye movements will be tracked to investigate how an observer scans videos. The distance from the monitor to the participant's eyes is very important, and so, the participant will need:
- to place his/her chin in the chinrest;
 - to avoid leaning backwards;
 - to look at different places in the screen in order for the experimenter to adjust the system according to the iris and pupil of the participant.

Once the system is ready, the experimenter will ask the participant to continue. The eye-tracker tool will need to be calibrated with a simple task:

- Task:** The observer will have to concentrate on a black square in the screen, and follow it with his/hers eyes every time the square changes its position.
 - During this task, **the experimenter is only allowed to finish it if there is a problem, i.e.,?????** the experimenter should not interfere with the elapsing procedure.
 - **One might be that the calibration task does conclude or that was not successful.** In those cases, the calibration task can be repeated up to 3 times. If the problem persists, the experiment will have to come to an end and the participant will be dismissed.
- After task:** Once the calibration is complete, the experimenter will ask the observer to look at different places in the screen to confirm that the calibration was successful.
 - If at any moment the participant moves his/hers face and the eye-tracker loses the participant's pupil or/and iris, the experimenter is allowed to correct the eye-tracker tool position, so that it can continue tracking the participant's eye movements. Moreover, the experimenter can try to correct some Eye-Tracker parameters when the subject is looking at one of the videos.

does not
make sense

- (b) **Training task:** The participants will be performing 2 short training sessions. This task is concerned with defects or impairments in video and their effect on human viewers. Thus, in the first session ~~will be showed~~ high-definition videos ~~and next session~~ ^{will be shown and in the next session} strongly degraded videos. ^{will be shown} This task is ~~so~~ important to give ~~them~~ ^{in the experiment} an idea of the range of quality that ~~they~~ ^{they} will be seeing. The data from the training sessions will not be used for the study.
- (c) **Practice Trials:** The participants will have a practice trial to be sure that they understand the task. The most important is to know the initial impressions from the subjects after the video is played. Thus, they will be asked to estimate the annoyance of defects or impairments in the video. The defects can be found in any region of video and at any time during the clip. After the clip is played, the participants will be asked: "Did you see any defect or impairment?". Here, there are two possibilities:
- Answer NO:** if the participant did not see a defect (and, the experiment continues);
 - Answer YES:** if the participant detected a defect or impairment. Thus, they will be asked to indicate the ~~annoyance of the defect they have seen~~ ^{value of the} using a continuous scale with values ranging from 0 to 10. ~~It is to assign an annoyance value of 10 to the most annoying video.~~ ^{??} If the annoyance ~~value of a defect in the experiment is half of the worst sample clip, the participant will give it a 5; if it is 1/10th as bad, the participant will give it a 1. If the defect did not annoy the participant at all, score will be 0.~~ ^{should} ~~the~~ ^{should} ~~will~~ ^{should}.

The same questions will be asked after every trial. The data from the practice trials will not be used for the study, so it isn't a problem if the participant makes a mistake.

- (d) **Experiment:** Before the experiment starts, important ~~advices~~ ^{???} will be provided to the participant:
- *If he/she entered data incorrectly:* The participant should let the experimenter know. The experimenter will make note of the time as indicated in the iView interface and fix it later.
 - *If he/she needs to take a small break:* The participant should finish viewing the current video, ~~and rest before entering the corresponding score,~~ ^{???????} avoiding proceeding to the next video. ^{This sentence does not make sense.}
 - *If he/she ~~feels~~ ^{is} confused about what to do:* The participant should stop and let the experimenter know if he/she has a question ~~or doubt.~~

The experiment is split in 2 sessions and each one should last approximately 25 minutes. As in Practice Trials, they will be asked to estimate the annoyance of defects or impairments of each degraded video.

vague. I would put "It is expected that the observer takes a break of around 5-10 minutes"

- Session 1:** Once the participant has scored all videos of this session, ~~it will be given a break to~~ ^{will be given} he/she. The break will not have a ~~limit~~ ^{limit} time defined, but it is expected that the participant ~~begins the second session as soon as possible.~~ ^{begins the second session as soon as possible.} Once the participant is ready to continue, he/she will be instructed to begin the next session.
- Session 2:** Before the beginning of this session the calibration task will be repeated. When the system is ready, the experimenter will ask to the participant to proceed to the calibration task. Once the calibration task is finished, the participant will rate the remaining videos. When is finished, he/she may leave the room. A more detailed explanation about the experiment itself can be given to the participant, if asked.

B. Experimental Instructions

1. Before the subject arrives:

- (a) Log in to the server

(b) Initiate application

2. After the subject arrives:

- (a) Sit the subject in the chair, centered in front of the video monitor. The subject should be adjusted backward or forward to get a distance of 3 times the height of the picture in the video monitor screen. The most comfortable position for the subject tends to be leaning forward slightly with forearms or elbows on the table. The distance from the monitor to your eyes is important during the presentation. The subject should be instructed not to lean backward;
- (b) "The experiment is split in five sessions: equipment calibration, free viewing, training, practice trials, and main experimental session. At the beginning of each session, I will briefly explain what you are required to do at each stage.";
- (c) Eye-Tracking calibration: A screen will appear asking the subject to wait while you adjust the camera and try to ~~capture~~ ^{detect} the pupil. Adjust the system to the more stable settings. When you are finished, instruct the subject to ~~advance~~ ^{start the experiment}. Then instruct him/her to follow the black squares in the screen. Press the *space bar* to start the calibration;
- (d) Free viewing: "At this stage, you will be asked to watch seven high quality videos (original videos). All videos have ten seconds."; ????
- (e) [Play seven original videos];
- (f) "This study is concerned with defects or impairments in video images and their effect on human viewers. We are not concerned with the content of the videos. We are interested in whether or not you see any defects or impairments in the videos that we will show, and if so, how annoying (strong) the defect is.";
- (g) Training session: "Here is how you will determine the annoyance/strength value. I am about to show you a set of sample clips. The sample clips include two sets of videos. The first set has four high quality videos and the second set has four degraded quality videos. There may be some impairment in the high quality clips. This will give you an idea of the range of image quality that you will be seeing. You are to assign an annoyance value of 10 to the most annoying video among the sample clips.";
- (h) Practice Trials: "Before we start the experiment, you will have 6 practice trials to be sure that you understand the task. You will be asked to perform the exact same tasks you will perform in the main experiment. You will respond in these trials just like you will in the main experiment. We will not use the data from the practice trials, so do not be concerned if you make a mistake here. If you have any questions or concerns, ask the experimenter at any time.";

You will be presented with one video clip on each trial. Each clip will last ten seconds and will be played once. After the clip is played, questions will appear on the monitor. The same questions will be asked after every trial. Do not spend a lot of time thinking about your responses. We want to know your initial impressions;

You will be asked to estimate the annoyance of defects or impairments in the video. The defects can be found in any region of video and at any time during the clip. After the clip is played, you will be asked "Did you see any defect or impairment"?

"If you did not see a defect, answer NO. Then, Left-click to see the next the video."

"For those clips in which you do detect a defect or impairment, answer YES. You will be then asked to indicate the annoyance of the defect you saw using a continuous scale with values ranging from 0 and 10 will appear. You are to assign an annoyance value of 10 to the most annoying video. If the annoyance value of a defect in the experiment is half of the worst sample

clip, give it a 5; if it is $\frac{1}{10}$ th as bad, give it a 1. If the defect did not annoy you at all, call it 0. You should enter the scores using the mouse to click on the desired value. After you finished entering your choice of number, Left-click to see the next the video.”;

- (i) [Start the main Experiment];
- (j) The experiment is divided in two parts. Each part should last approximately 25 minutes. A break will be given after the first part of the experiment is finished.

“Do you have any questions?”

- (k) “You can take a break at any time by entering your answers for the most recent video, but waiting to *Left-click* until you are ready to go on. You should stop if you are confused about what to do, if you realize you have entered data incorrectly, or if you need a break. You can’t stop the video from playing or go back and fix the data from a previous clip afterwards. So if something goes wrong, watch the video and then tell the experimenter. We will go back and fix it later. The questions will come up on the computer screen, but you should not need to look over at it every time. The questions will not change.”;
- (l) First part will be showed some video sequences. When the first part is finished, a break will be given.
- (m) After break, it will be asked if the participant is ready to continue. It will be necessary to perform the calibration task again. When the system is ready, the experimenter will ask he/she to proceed to the task.
- (n) Second part will be showed remaining video sequences. When this part is finished, the experiment will be completed and the participant may leave the room.

3. All *Instructions* used in this experiment are showed in Appendix B.

TABLE VII: Degraded videos used during main experiment session.

APPENDIX B: INSTRUCTIONS SHOWN DURING THE EXPERIMENT

1st Instruction:

Please type in your name and press return

2nd Instruction:

Welcome! Thank you for participating in this experiment. The experiment is divided in 5 sessions:

- (1) Equipment Calibration,*
- (2) Free Viewing,*
- (3) Training,*
- (4) Practice Trials,*
- (5) Main Experimental Session.*

At the beginning of each session, I will briefly explain what you are required to do at each stage. Left-click to continue.

3rd Instruction:

The distance from the monitor to your eyes is very important during the presentation.

Please put your head on the CHIN-REST in front of you. Try not to lean backward.

Left-click to continue

4th Instruction:

- (1) CALIBRATION SESSION*

Please, wait for a few seconds while I adjust the system.

When the system is ready, I will ask you to continue.

Left-click to continue

5th Instruction:

- (1) CALIBRATION SESSION*

You're now going to see a series of small black SQUARES on the screen.

At each screen, one black square will appear at a different position.

Please, keep your eyes fixated on each of these squares.

Left-click to continue

6th Instruction:

- (1) CALIBRATION SESSION Thank you! The calibration is now complete.*

Left-click to continue

7th Instruction:

- (2) FREE VIEWING SESSION You are now going to watch a series of 7 videos.*

Please, watch them as if you were at home watching TV.

Whenever you are ready to start, please left-click to continue.

8th Instruction:

- (3) TRAINING SESSION*

This study is concerned with defects or impairments in video images and their effect on human viewers.

We are not concerned with the content of the videos.

We are interested in whether or not you see any defects or impairments in the videos that we will show, and if so, how annoying defect is.

Left-click to continue

9th Instruction:

- (3) TRAINING SESSION*

Here is how you will determine the annoyance value. I am about to show you a set of sample clips.
The sample clips include two sets of videos. The first set has 4 high quality videos.
Left-click to play the set of high quality videos.

10th Instruction:

(3) TRAINING SESSION

The second set has degraded videos. They will give you an idea of the range of quality that you will be seeing.
You are to assign an ANNOYANCE value of 10 to the most annoying video among the sample clips.
Left-click to play the set of impaired videos

11th Instruction:

(3) TRAINING SESSION

Did you see any defects?

Remember that the most annoying defect that you have seen is to have a value of 10.

If the annoyance value of a defect in the experiment is half of the worst sample clip, give it a 5;
if it is 1/10th as bad, give it a 1.

If the defect did not annoy you at all, call it zero.

Left-click to continue

12th Instruction:

(4) PRACTICE TRIAL SESSION

Before we start the experiment, you will have 6 practice trials to be sure that you understand the task.

You will be asked to perform the exact same tasks you will perform in the main experiment.

You will respond in these trials just like you will in the main experiment.

We will not use the data from the practice trials, so don't be concerned if you make a mistake here.

If you have any questions or concerns, feel free to ask me.

Left-click to continue

13th Instruction:

(4) PRACTICE TRIAL SESSION

You will be presented with one video clip on each trial.

Each clip will last 10 seconds and will be played once.

After the clip is played, questions will appear on the monitor.

The same questions will be asked after every trial. Do not spend a lot of time thinking about your responses.

We want to know your initial impressions.

Left-click to continue

14th Instruction:

(4) PRACTICE TRIAL SESSION

You will be asked to estimate the annoyance of defects or impairments in the video.

The defects can be found in any region of video and at any time during the clip.

After the clip is played, you will be asked: Did you see any defect or impairment?

If you did not see a defect, answer NO. Then, Left-click to play the next clip.

Left-click to continue

15th Instruction:

(4) PRACTICE TRIAL SESSION

For those clips in which you do detect a defect or impairment, answer YES.

You will be then asked to indicate the annoyance of the defect you saw using a scale with values ranging from 0 and 10.

You are to assign an annoyance value of 10 to the most annoying video.

If the annoyance value of a defect in the experiment is half of the worst sample clip, give it a 5; if it is 1/10th as bad, give it a 1.

If the defect did not annoy you at all, call it zero.

You should enter the scores using the mouse to LEFT-click on the desired value.

Left-click to continue

16th Instruction:

(4) PRACTICE TRIAL SESSION

After you finished entering your choice of number, Left-click to play the next video.

Do you have any questions?

Left-click to start PRACTICE TRIALS.

17th Instruction:

Did you perceive any impairments or defects in the video?

18th Instruction:

(5) MAIN EXPERIMENT SESSION

The experiment is divided in 2 parts. Each part should last approximately 25 minutes.

A break will be given after the first part of the experiment is finished.

If you need to take a small break at any time, enter your answers for the most recent video, but wait to Left-click until you are ready to go on.

You should stop if you are confused about what to do.

If you realize you have entered data incorrectly, tell me and I will go back and fix it later.

Left-click to continue

19th Instruction:

(5) MAIN EXPERIMENT SESSION – PART I

Do you have any questions?

Left-click to start PART I

20th Instruction:

Did you perceive any impairments or defects in the video?

21st Instruction:

This is the end of the first part of the experiment.

Please Left-click whenever you are ready to resume the experiment.

22nd Instruction:

(1) CALIBRATION SESSION – PART II

You are now going to perform the calibration session again.

Please, wait for a few seconds while the experimenter adjusts the system.

When the system is ready, the experimenter will ask you to continue.

Left-click to continue

23rd Instruction:

(1) CALIBRATION SESSION – PART II

You're now going to see a series of small black SQUARES on the screen.

At each screen, one black square will appear at a different position.

Please, keep your eyes fixated on each of these squares.

Left-click to continue

24th Instruction:

*Thank you! The calibration is now complete.
Left-click to start the Part II of the experiment.
Left-click to continue*

25th Instruction:

Did you perceive any impairments or defects in the video?

26th Instruction:

This is the end of the experiment. Thank you for participating!
